Section 4: Training approaches

Revisit the definition of generative retrieval

GR usually exploits a Seq2Seq encoder-decoder architecture to generate a ranked list of docids for an input query, in an autoregressive fashion

Standard training objective

The commonly used training objective for both indexing and retrieval is **maximum likelihood estimation** (MLE):

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(D, I_D; \theta) + \mathcal{L}_{Retrieval}(Q, I_Q; \theta) \\ &= - \sum_{d \in D} \log P(id \mid d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid q; \theta)\end{aligned}$$

Different learning scenarios based on the corpus

$$\begin{aligned}\mathcal{L}_{Global}(Q, \underline{\mathcal{D}}, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(\underline{\mathcal{D}}, I_D; \theta) + \mathcal{L}_{Retrieval}(Q, I_Q; \theta) \\ &= - \sum_{d \in \underline{\mathcal{D}}} \log P(id \mid d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid q; \theta)\end{aligned}$$

Different learning scenarios based on the corpus

$$\begin{aligned}\mathcal{L}_{Global}(Q, \underline{\mathcal{D}}, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(\underline{\mathcal{D}}, I_D; \theta) + \mathcal{L}_{Retrieval}(Q, I_Q; \theta) \\ &= - \sum_{d \in \underline{\mathcal{D}}} \log P(id \mid d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid q; \theta)\end{aligned}$$

- **Stationary scenarios:** The document collection is fixed
- **Dynamic scenarios:** Information changes and new documents emerge incrementally over time

Stationary scenarios

$$\begin{aligned}\mathcal{L}_{Global}(\underline{Q}, D, I_D, \underline{I_Q}; \theta) &= \mathcal{L}_{Indexing}(D, I_D; \theta) + \mathcal{L}_{Retrieval}(\underline{Q}, \underline{I_Q}; \theta) \\ &= -\sum_{d \in D} \log P(id \mid d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(\textcolor{red}{id^q} \mid q; \theta)\end{aligned}$$

According to the **availability of labeled data**, the training approaches in stationary scenarios can be generally classified into:

- **Supervised learning methods**
- **Pre-training methods**

Supervised learning: Basic training method

- Learn the indexing task first, and then learn retrieval tasks
 - Step 1: $\mathcal{L}_{Indexing}(D, I_D; \theta) = -\sum_{d \in D} \log P(id \mid d; \theta)$
 - Step 2: $\mathcal{L}_{Retrieval}(Q, I_Q; \theta) = -\sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid q; \theta)$

Supervised learning: Basic training method

- Learn the indexing task first, and then learn retrieval tasks
 - Step 1: $\mathcal{L}_{Indexing}(D, I_D; \theta) = -\sum_{d \in D} \log P(id | d; \theta)$
 - Step 2: $\mathcal{L}_{Retrieval}(Q, I_Q; \theta) = -\sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q | q; \theta)$
- Learn indexing and retrieval tasks simultaneously in a **multitask** fashion

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(D, I_D; \theta) + \mathcal{L}_{Retrieval}(Q, I_Q; \theta) \\ &= -\sum_{d \in D} \log P(id | d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q | q; \theta)\end{aligned}$$

Supervised learning: Basic training method

- Learn the indexing task first, and then learn retrieval tasks
 - Step 1: $\mathcal{L}_{Indexing}(D, I_D; \theta) = -\sum_{d \in D} \log P(id | d; \theta)$
 - Step 2: $\mathcal{L}_{Retrieval}(Q, I_Q; \theta) = -\sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q | q; \theta)$
- Learn indexing and retrieval tasks simultaneously in a **multitask** fashion

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(D, I_D; \theta) + \mathcal{L}_{Retrieval}(Q, I_Q; \theta) \\ &= -\sum_{d \in D} \log P(id | d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q | q; \theta)\end{aligned}$$

Limitation (1): Single document granularity

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \underline{\mathcal{L}_{Indexing}(D, I_D; \theta)} + \mathcal{L}_{Retrieval}(Q, I_Q; \theta) \\ &= - \sum_{d \in D} \log P(id \mid \textcolor{red}{d}; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid q; \theta)\end{aligned}$$

Limitation (1): Single document granularity

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \underline{\mathcal{L}_{Indexing}(D, I_D; \theta)} + \mathcal{L}_{Retrieval}(Q, I_Q; \theta) \\ &= - \sum_{d \in D} \log P(id \mid \textcolor{red}{d}; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid q; \theta)\end{aligned}$$

When indexing, memorizing each document at a single granularity, e.g., first L tokens or the full text, is **insufficient**, especially for long documents with rich semantics.

Supervised learning: Multi-granularity enhanced

- Given a document, the **important passages p** and **sentences s** are selected to augment the indexing data

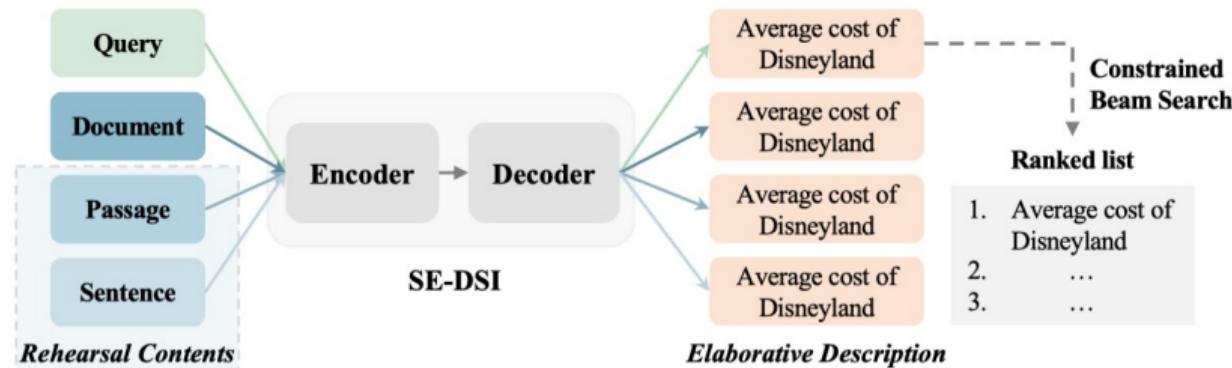

Supervised learning: Multi-granularity enhanced

- Given a document, the **important passages p** and **sentences s** are selected to augment the indexing data

$$\mathcal{L}_{Indexing}(D, I_D; \theta) = -\left(\sum_{d \in D} \log P(id | \textcolor{red}{d}; \theta) + \sum_{p \in d} \log P(id | \textcolor{red}{p}; \theta) + \sum_{s \in d} \log P(id | \textcolor{red}{s}; \theta)\right)$$

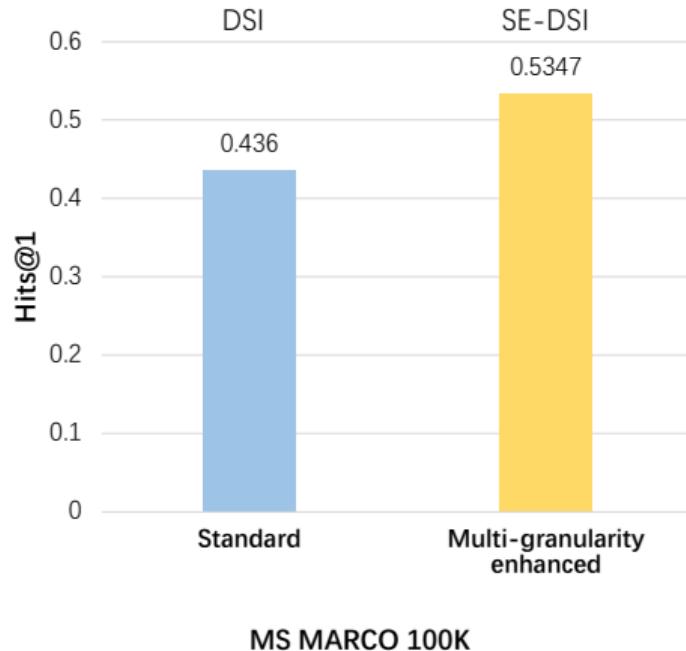

Supervised learning: Multi-granularity enhanced

- Leading-style: Directly use the leading passages and sentences
- Summarization-style: Leverage the document summarization technique, e.g., TextRank, to highlight important parts

Comparisons

Data source: Tang et al. [2023a]

- Backbone: T5-base
- Multi-granularity representations of documents can comprehensively encode the documents, and further contribute to the retrieval

Limitation (2): The gap between indexing and retrieval

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(\underline{D}, I_D; \theta) + \mathcal{L}_{Retrieval}(\underline{Q}, I_Q; \theta) \\ &= - \sum_{d \in D} \log P(id \mid \underline{d}; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid \underline{q}; \theta)\end{aligned}$$

Limitation (2): The gap between indexing and retrieval

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(\underline{D}, I_D; \theta) + \mathcal{L}_{Retrieval}(\underline{Q}, I_Q; \theta) \\ &= - \sum_{d \in D} \log P(id \mid \underline{d}; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid \underline{q}; \theta)\end{aligned}$$

Long document in indexing vs. Short query in retrieval

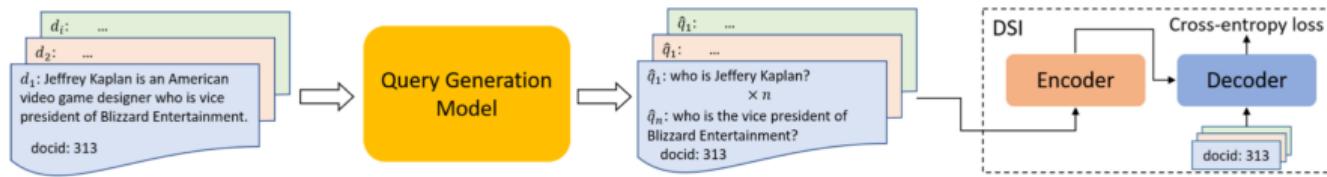

Limitation (2): The gap between indexing and retrieval

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(\underline{D}, I_D; \theta) + \mathcal{L}_{Retrieval}(\underline{Q}, I_Q; \theta) \\ &= - \sum_{d \in D} \log P(id \mid \underline{d}; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid \underline{q}; \theta)\end{aligned}$$

Long document in indexing vs. Short query in retrieval

The data distribution mismatch that occurs between the indexing and retrieval

Supervised learning: Pseudo query enhanced

Using a set of **pseudo queries pq** generated from the document as the inputs of the indexing task

Supervised learning: Pseudo query enhanced

$$\mathcal{L}_{Indexing}(D, I_D; \theta) = - \sum_{d \in D} \log P(id | \underline{\textcolor{red}{d}}; \theta)$$

$$\mathcal{L}_{Indexing}(D, I_D; \theta) = - \sum_{pq \in D} \log P(id | \underline{\textcolor{red}{pq}}; \theta)$$

Supervised learning: Pseudo query enhanced

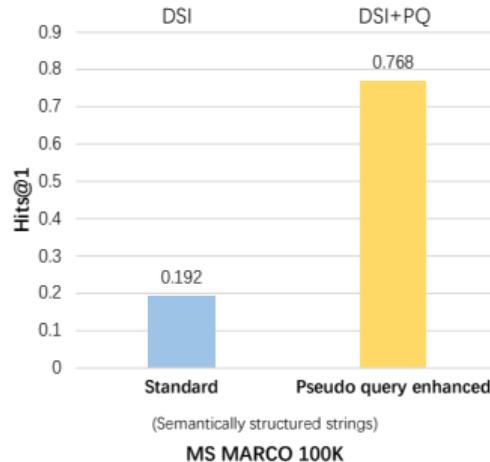

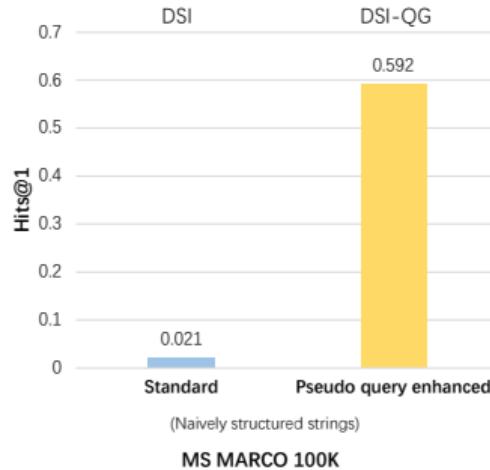

$$\mathcal{L}_{Indexing}(D, I_D; \theta) = - \sum_{d \in D} \log P(id | \underline{d}; \theta)$$

$$\mathcal{L}_{Indexing}(D, I_D; \theta) = - \sum_{pq \in D} \log P(id | \underline{pq}; \theta)$$

$$\mathcal{L}_{Retrieval}(Q, I_Q; \theta) = - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q | \underline{q}; \theta)$$

Comparisons

Data source: Pradeep et al. [2023], Zhuang et al. [2023]

- Backbone: T5-base
- Using only pseudo synthetic queries to docid during indexing is an effective training strategy on MS MARCO [Pradeep et al., 2023]

Limitation (3): Limited labeled data

$$\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) = \mathcal{L}_{Indexing}(D, I_D; \theta) + \boxed{\mathcal{L}_{Retrieval}(Q, I_Q; \theta)} ?$$

Limitation (3): Limited labeled data

$$\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) = \mathcal{L}_{Indexing}(D, I_D; \theta) + \boxed{\mathcal{L}_{Retrieval}(Q, I_Q; \theta)} ?$$

What should we do if there is no or few labeled query-docid pairs?

Pre-training methods

Constructing **pseudo query-docid pairs** (PQ, I_Q^P) for the **pre-training** retrieval task

$$\mathcal{L}_{Pre-train}(PQ, D, I_D, I_Q^P; \theta) = \mathcal{L}_{Indexing}(D, I_D; \theta) + \underline{\mathcal{L}_{Retrieval}(PQ, I_Q^P; \theta)}$$

Apple Inc.

Apple Inc. is an American multinational technology company that specializes in consumer electronics, software and online services. Apple is the largest information technology company by revenue [...]

Apple was founded as Apple Computer Company on April 1, 1976, by Steve Jobs, Steve Wozniak and Ronald Wayne to develop and sell Wozniak's Apple I personal computer [...] Apple went public in 1980, to instant financial success. The company developed computers featuring innovative graphical user interfaces, including the original Macintosh, announced in a critically acclaimed advertisement, "1984", directed by Ridley Scott. By 1985, the high cost of its products and power struggles between executives caused problems. Wozniak stepped back from Apple amicably, while Jobs resigned to found NeXT, taking some Apple employees with him.

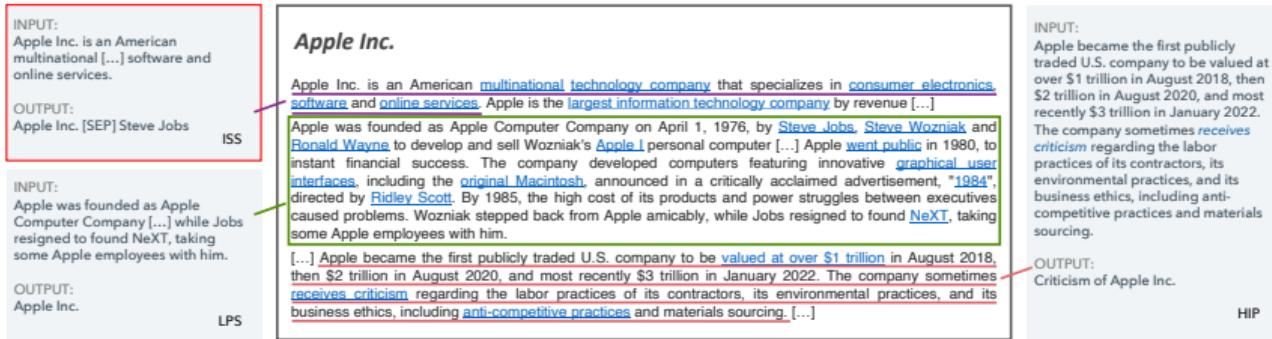

[...] Apple became the first publicly traded U.S. company to be valued at over \$1 trillion in August 2018, then \$2 trillion in August 2020, and most recently \$3 trillion in January 2022. The company sometimes receives criticism regarding the labor practices of its contractors, its environmental practices, and its business ethics, including anti-competitive practices and materials sourcing. Based on Wikipedia, three pre-training retrieval tasks are constructed

CorpusBrain [Chen et al., 2022]: Pre-training

Inner Sentence Selection (ISS):

- Pseudo query (PQ): Randomly selected **inner sentence** from its document
- Docid (I_Q^P): Concatenated relevant **document titles**, i.e., “title [SEP] title [SEP] title”

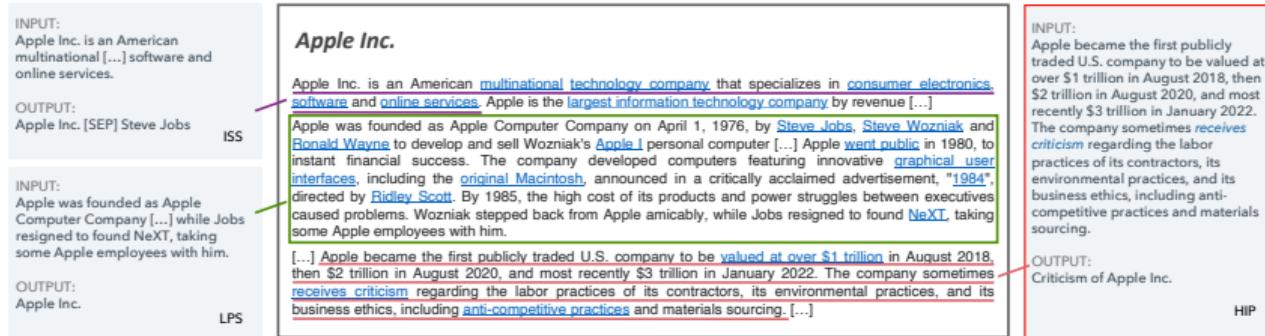

CorpusBrain [Chen et al., 2022]: Pre-training

Lead Paragraph Selection (LPS):

- Pseudo query (PQ): A (lead) **paragraph** is sampled from the document
- Docid (I_Q^P): Concatenated relevant **document titles**

CorpusBrain [Chen et al., 2022]: Pre-training

Hyperlink Identifier Prediction (HIP):

- Pseudo query (PQ): The **anchor context**, i.e., the surrounding contextual information in the anchor's corresponding sentence
- Docid (I_Q^P): The **document title** of the destination page

CorpusBrain [Chen et al., 2022]: Training and inference

- **Pre-training:** Based on the three pre-training tasks, a large number of pseudo pairs of query and document identifiers are constructed. All the tasks are formulated by a standard seq2seq objective for the pre-training

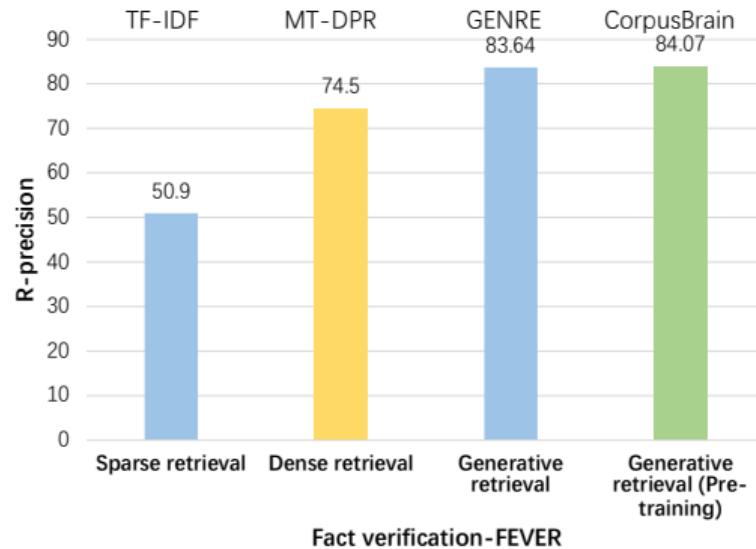

CorpusBrain [Chen et al., 2022]: Training and inference

- **Pre-training:** Based on the three pre-training tasks, a large number of pseudo pairs of query and document identifiers are constructed. All the tasks are formulated by a standard seq2seq objective for the pre-training
- **Fine-tuning:** CorpusBrain is fine-tuned using the processed data (in a Seq2Seq pair format) in downstream tasks

CorpusBrain [Chen et al., 2022]: Training and inference

- **Pre-training:** Based on the three pre-training tasks, a large number of pseudo pairs of query and document identifiers are constructed. All the tasks are formulated by a standard seq2seq objective for the pre-training
- **Fine-tuning:** CorpusBrain is fine-tuned using the processed data (in a Seq2Seq pair format) in downstream tasks
- **Test:** Given a test query, the fine-tuned CorpusBrain utilizes constrained beam search to decode relevant docids

CorpusBrain [Chen et al., 2022]: Performance

- In the KILT leaderboard, Corpusbrain achieved first place in 5 of them, second place in 1 task, and third place in 4 tasks, outperforming traditional pipelined approaches

Limitation (4): Pointwise optimization for GR

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(D, I_D; \theta) + \underline{\mathcal{L}_{Retrieval}(Q, I_Q; \theta)} \\ &= -\sum_{d \in D} \log P(id \mid d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \underline{\log P(id^q \mid q; \theta)}\end{aligned}$$

Limitation (4): Pointwise optimization for GR

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(D, I_D; \theta) + \underline{\mathcal{L}_{Retrieval}(Q, I_Q; \theta)} \\ &= -\sum_{d \in D} \log P(id \mid d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid q; \theta)\end{aligned}$$

- It assumes the likelihood for each relevant docid is **independent** of the other docids in the list for a query
- Ranking is a prediction task on **list of objects**

Limitation (4): Pointwise optimization for GR

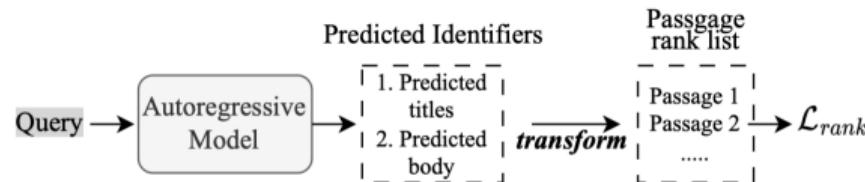

$$\begin{aligned}\mathcal{L}_{Global}(Q, D, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(D, I_D; \theta) + \underline{\mathcal{L}_{Retrieval}(Q, I_Q; \theta)} \\ &= -\sum_{d \in D} \log P(id \mid d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid q; \theta)\end{aligned}$$

- It assumes the likelihood for each relevant docid is **independent** of the other docids in the list for a query
- Ranking is a prediction task on **list of objects**

Pairwise and listwise optimization strategies for GR are necessary!

Pairwise optimization: LTRGR [Li et al., 2023c]

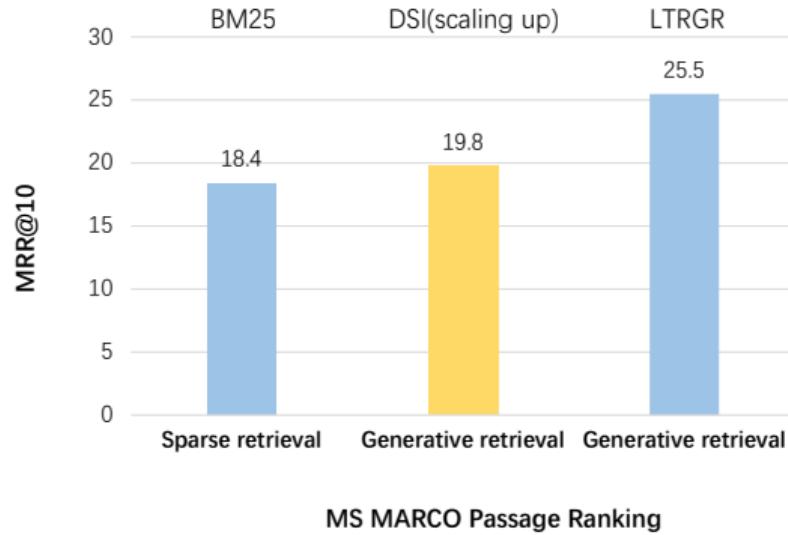

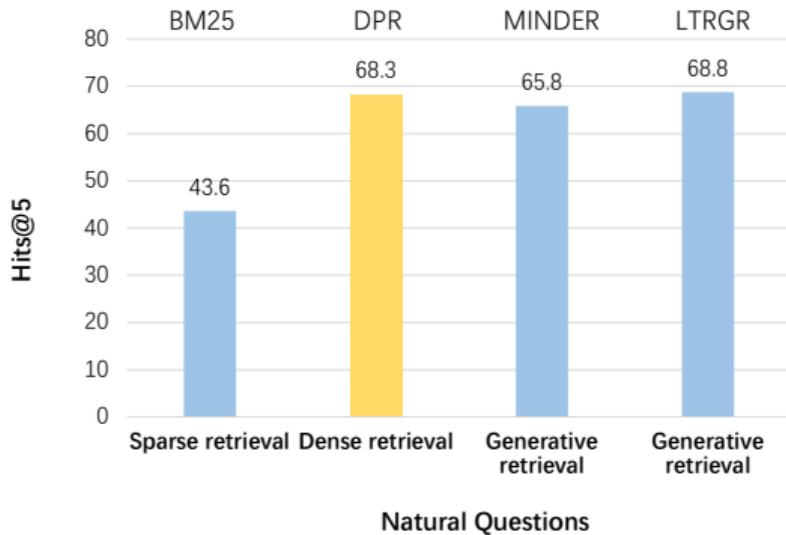

- Step 1: Initial training with pointwise optimization
- Step 2: Based on the trained initial model, perform **pairwise** optimization

$$\max(0, s(q, d_-) - s(q, d_+) + m),$$

where d_- and d_+ are negative and positive documents, and m is the margin

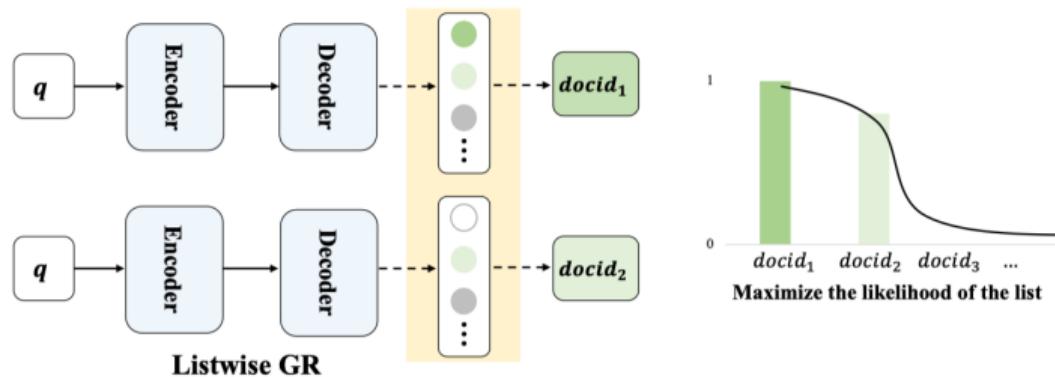

LTRGR [Li et al., 2023c]: Performance

Listwise optimization: [Tang et al., 2023b]

Training with position-aware ListMLE

- View the docid ranking problem as a **sequential learning process**, with each step targeting to maximize the corresponding stepwise probability distribution

Listwise optimization: [Tang et al., 2023b]

Given:

- A query q
- Its ground-truth docid list $\pi_q = [id^{(1)}, id^{(2)}, \dots]$, in descending order of relevance, where $id^{(1)}$ is the docid ranked at the first position, and $id^{(2)}$ is the docid ranked at the second position, and so on

Sequential learning process

Step 1: Maximize the following top-1 positional conditional probability:

$$P(id^{(1)} | q; \theta) = \frac{\exp(\tilde{P}(id^{(1)} | q; \theta))}{\sum_{j=1}^n \exp(\tilde{P}(id^{(j)} | q; \theta))},$$

where $\tilde{P}(id^{(i)} | q; \theta) = \frac{\log \prod_{t \in [1, |id^{(i)}|]} P(w_t | q, w_{<t}; \theta)}{|id^{(i)}|}$ (without considering the ranking order information), and $P(id^{(i)} | q; \theta)$ is the generated likelihood of the i -th relevant docid $id^{(i)}$ for q

Sequential learning process

Step 2: For $i = 2, \dots, n$, maximize the following i -th positional conditional probability given the preceding top $i - 1$ docids,

$$P(id^{(i)} | q, id^{(1)}, \dots, id^{(i-1)}; \theta) = \frac{\exp(\tilde{P}(id^{(i)} | q; \theta))}{\sum_{j=i}^n \exp(\tilde{P}(id^{(j)} | q; \theta))}$$

The learning process ends at step $n + 1$

Listwise loss with position importance

- Listwise probability with position importance

$$\min_{\theta} - \log P(\pi_q | q; \theta)$$

$$= -\alpha(1) \log P(id^{(1)} | q; \theta) - \sum_{i=2}^n \alpha(i) \log P(id^{(i)} | q, id^{(1)}, \dots, id^{(i-1)}; \theta),$$

where the weight $\alpha(\cdot)$ is a decreasing function

- Listwise loss function incorporating the probability based on Plackett-Luce model

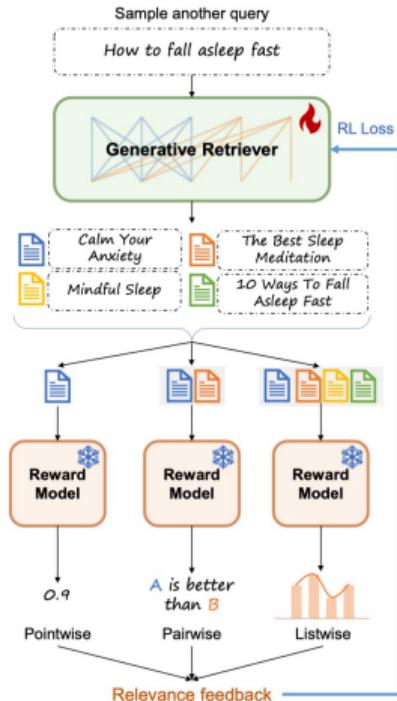

$$\mathcal{L}_{List}(q, \pi_q; \theta) = \sum_{i=1}^n \alpha(i) \left(-\tilde{P}(id^{(i)} | q; \theta) + \log \left(\sum_{k=i}^n \exp(\tilde{P}(id^{(k)} | q; \theta)) \right) \right)$$

Multiple optimization: GenRRL [Zhou et al., 2023]

Based on reinforce learning framework

- train a linear reward model
- train a GR model with **pointwise, pairwise and listwise** optimization strategies

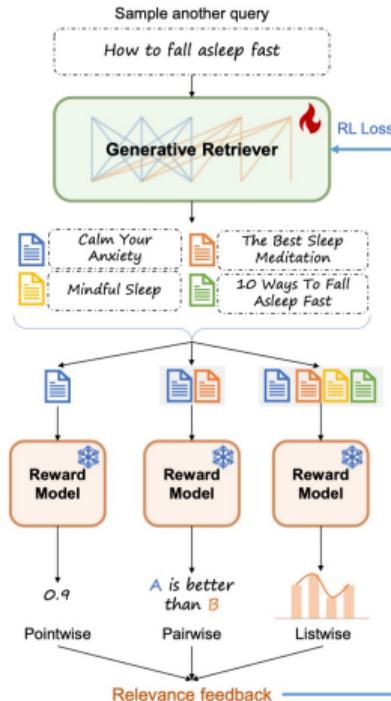

Multiple optimization: GenRRL [Zhou et al., 2023]

- Pointwise optimization:

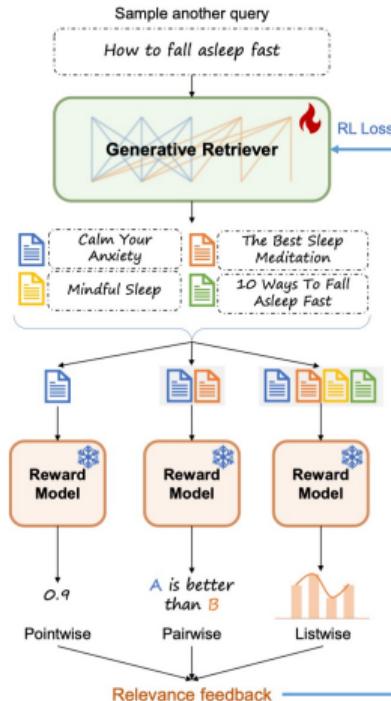

$-\sum_i(R(q, id_i) - b) \sum_t \log P(w_t^i | w_{<t}, q)$,
where R is a reward model, and b is a baseline

Multiple optimization: GenRRL [Zhou et al., 2023]

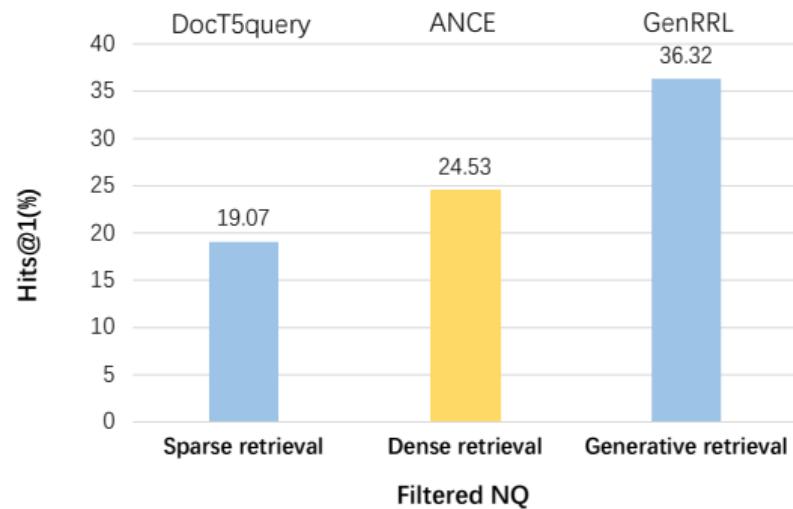

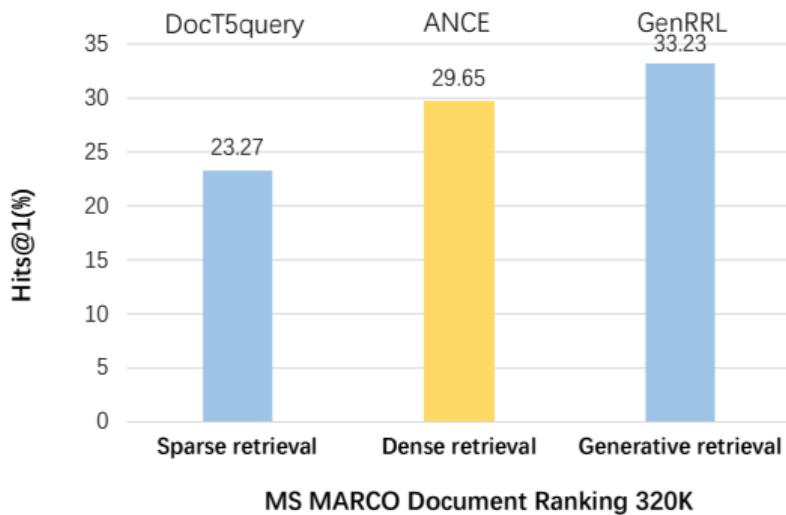

- Pointwise optimization:
– $\sum_i (R(q, id_i) - b) \sum_t \log P(w_t^i | w_{<t}, q)$,
where R is a reward model, and b is a baseline
- Pairwise optimization:
– $\sum_{(id_i, id_j)} (R(q, id_i) \log p_{ij} + R(q, id_j) \log p_{ji})$,
where $p_{ij} = |P(w_t^i | q) - P(w_t^j | q)|$

Multiple optimization: GenRRL [Zhou et al., 2023]

- Pointwise optimization:
– $\sum_i (R(q, id_i) - b) \sum_t \log P(w_t^i | w_{<t}, q)$,
where R is a reward model, and b is a baseline
- Pairwise optimization:
– $\sum_{(id_i, id_j)} (R(q, id_i) \log p_{ij} + R(q, id_j) \log p_{ji})$,
where $p_{ij} = |P(w_t^i | q) - P(w_t^j | q)|$
- Listwise optimization:
– $\sum_{id_i \in C} R(q, id_i) \log \frac{\exp(P(id_i|q))}{\sum_j \exp(P(id_j|q))}$

GenRRL [Zhou et al., 2023]: Performance

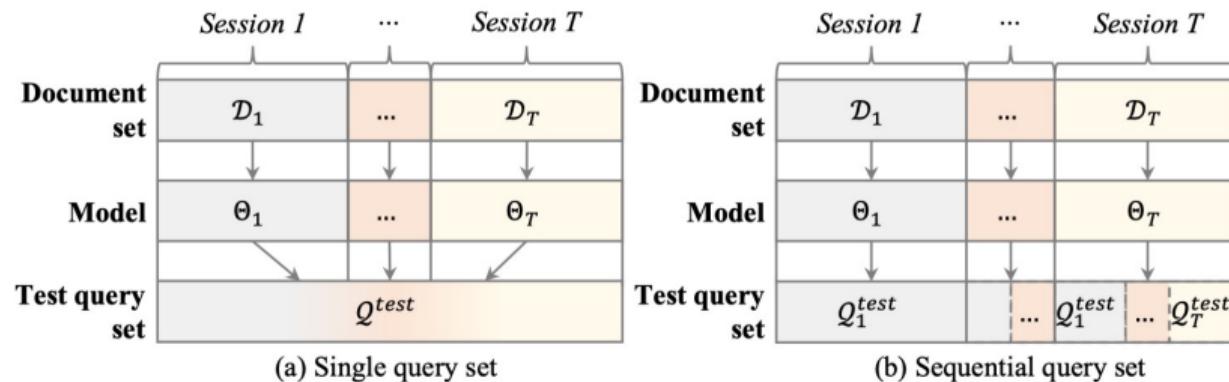

Dynamic scenarios

$$\begin{aligned}\mathcal{L}_{Global}(Q, \underline{\mathcal{D}}, I_D, I_Q; \theta) &= \mathcal{L}_{Indexing}(\underline{\mathcal{D}}, I_D; \theta) + \mathcal{L}_{Retrieval}(Q, I_Q; \theta) \\ &= - \sum_{d \in \underline{\mathcal{D}}} \log P(id \mid d; \theta) - \sum_{q \in Q} \sum_{id^q \in I_Q} \log P(id^q \mid q; \theta)\end{aligned}$$

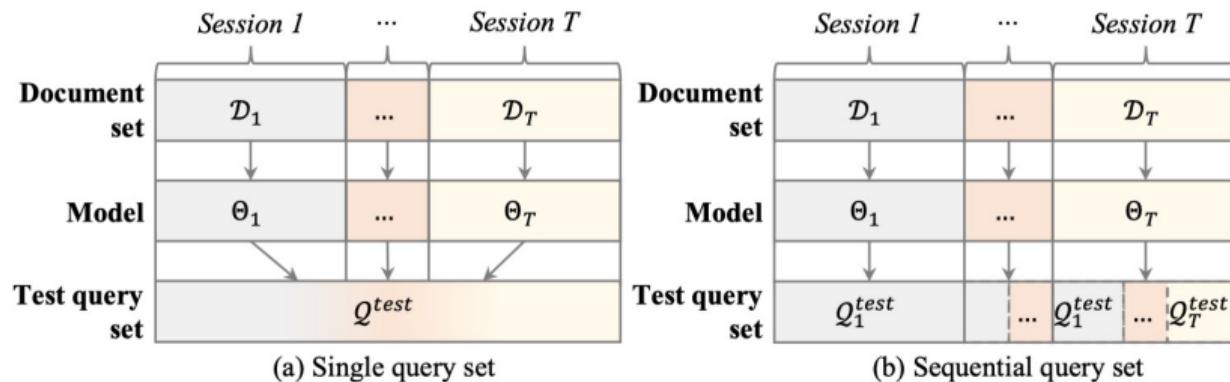

Information changes and new documents emerge incrementally over time

Continual learning task: Formulation

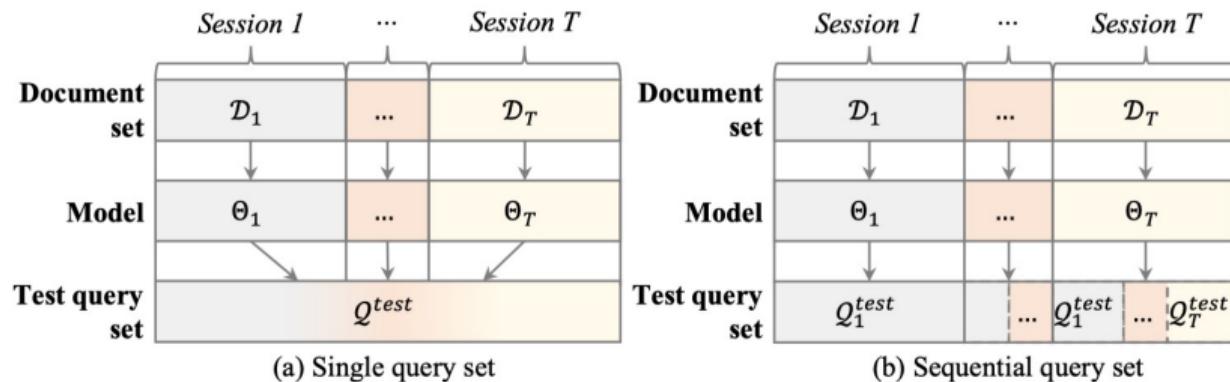

- **Initial model:** A large-scale base document set D_0 and sufficiently many labeled query-document pairs

Continual learning task: Formulation

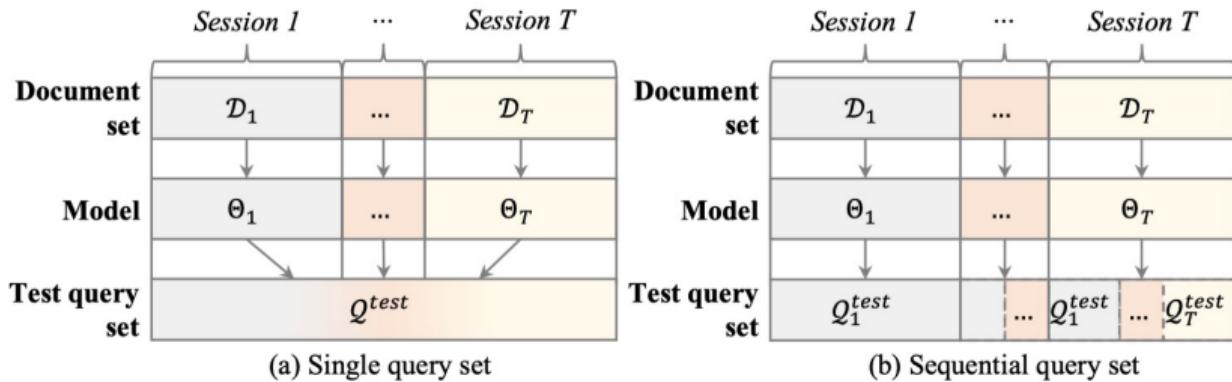

- **Initial model:** A large-scale base document set D_0 and sufficiently many labeled query-document pairs
- **New datasets:** T new datasets D_1, \dots, D_T , from T sessions arriving in a sequential manner, which are only composed of newly encountered documents without queries related to these documents

Continual learning task: Formulation

- **Initial model:** A large-scale base document set D_0 and sufficiently many labeled query-document pairs
- **New datasets:** T new datasets D_1, \dots, D_T , from T sessions arriving in a sequential manner, which are only composed of newly encountered documents without queries related to these documents
- **Model update:** The new dataset D_t and previous datasets D_0, \dots, D_{t-1}

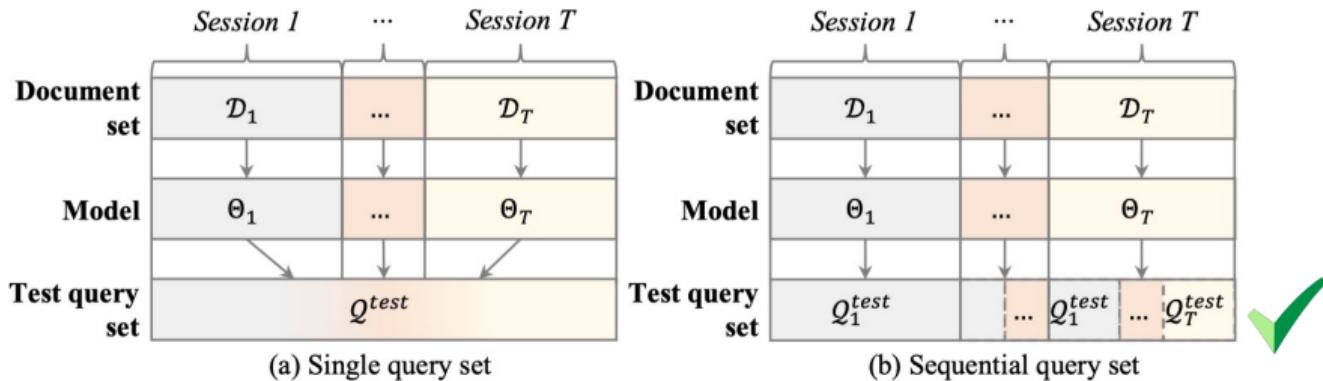

Continual learning task: Evaluation

Two types of test query set for performance evaluation:

- **Single query set:** There is only one test query set, and their relevant documents arrive in different sessions
- **Sequential query set:** The test query set is specific for each session, and the relevant documents appear in existing sessions

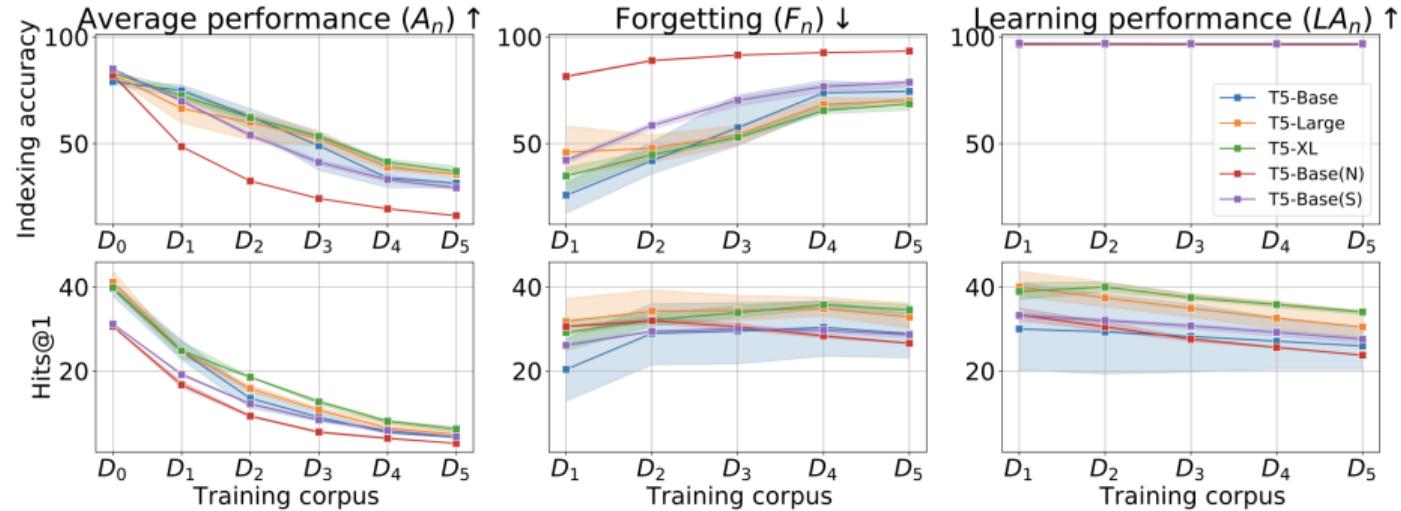

Continual learning task: Evaluation

Two types of test query set for performance evaluation:

- **Single query set:** There is only one test query set, and their relevant documents arrive in different sessions
- **Sequential query set:** The test query set is specific for each session, and the relevant documents appear in existing sessions

Catastrophic forgetting

The GR model undergoes **severe forgetting under continual indexing of new documents**

Challenges of continual learning for GR

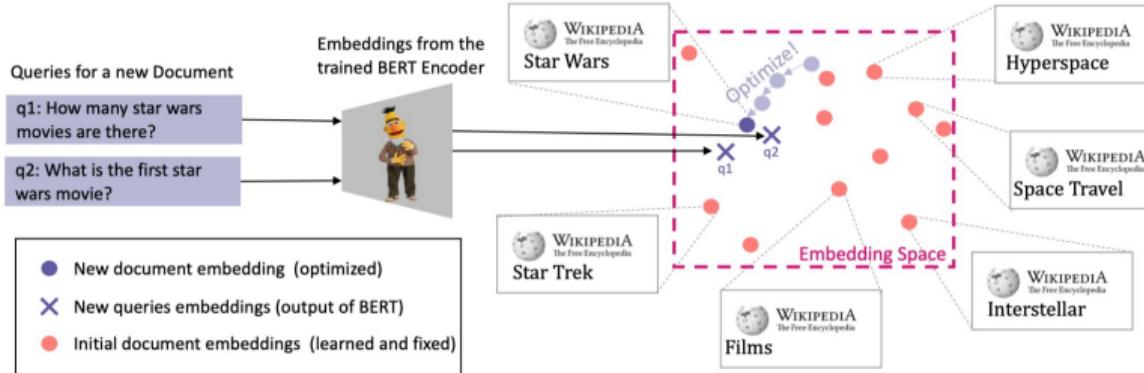

- How to incrementally index new documents with low computational and memory costs?

Challenges of continual learning for GR

- How to incrementally index new documents with low computational and memory costs?
- How to prevent catastrophic forgetting for previously indexed documents and maintain the retrieval ability?

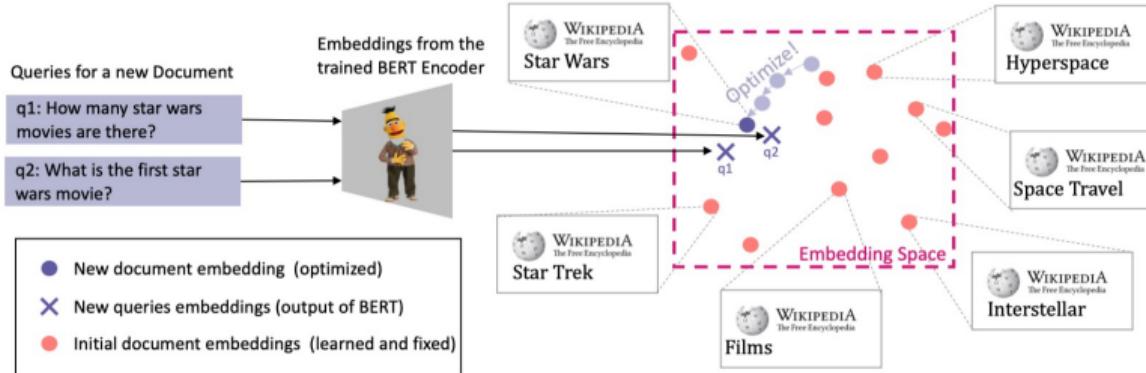

- Docid: unique atomic integers
- Constrained optimization problem: find the optimal document vector for a new document, do not modify any other existing document vectors and do not require broader updates to the query encoder

IncDSI [Kishore et al., 2023]: Incrementally indexing new documents

- Constrained optimization:
 - The new document is scored higher than all the existing documents for its representative query embedding

IncDSI [Kishore et al., 2023]: Incrementally indexing new documents

- Constrained optimization:
 - The new document is scored higher than all the existing documents for its representative query embedding
 - The new document is scored lower than all the existing documents for other representative query embedding

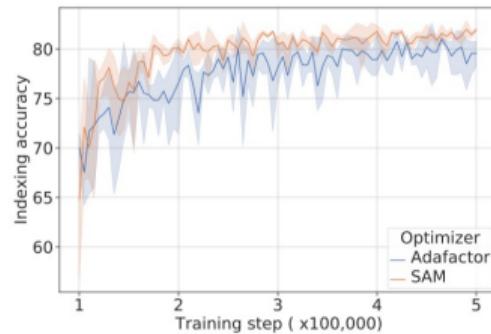

DSI++ [Mehta et al., 2022]: Incrementally indexing new documents

- Docids: The new documents are assigned **unstructured atomic integers** as docids, and the GR model learns new embeddings for each of them

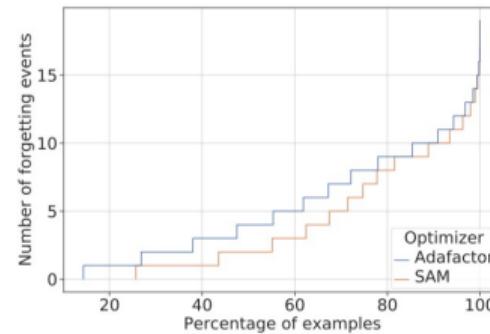

DSI++ [Mehta et al., 2022]: Incrementally indexing new documents

- Docids: The new documents are assigned **unstructured atomic integers** as docids, and the GR model learns new embeddings for each of them
- **Modifying the training dynamics:** Since flatter minima implicitly alleviate forgetting, optimizing for flatter loss basins using Sharpness-Aware Minimization (SAM) as an objective allows the model to stably memorize more documents

DSI++ [Mehta et al., 2022]: Incrementally indexing new documents

(a) Indexing accuracy during memorization

(b) Cumulative histogram of forgetting events

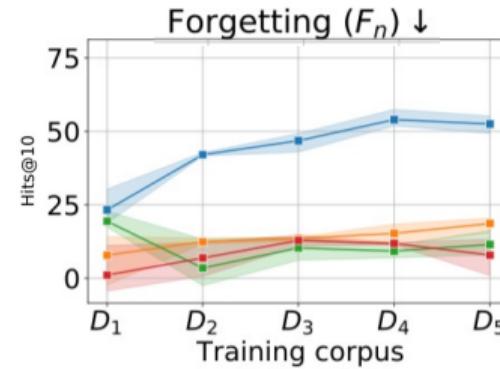

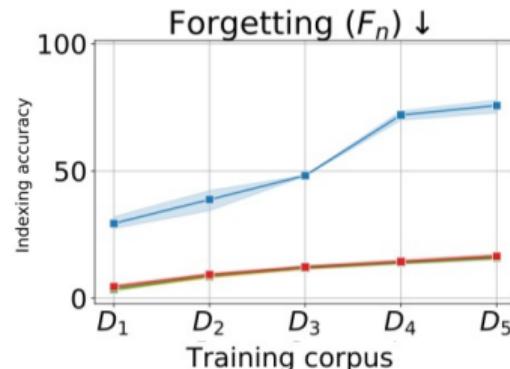

- SAM **outperforms Adafactor** in terms of the overall indexing accuracy
- SAM **undergoes less severe fluctuations** during the course of training

DSI++ [Mehta et al., 2022]: Preventing catastrophic forgetting

- **Generative memory:** Train a query generator model to sample pseudo-queries for previously seen documents and supplement the query-docid pairs during continual indexing

DSI++ [Mehta et al., 2022]: Preventing catastrophic forgetting

- **Generative memory:** Train a query generator model to sample pseudo-queries for previously seen documents and supplement the query-docid pairs during continual indexing
- It **reduces the forgetting**, and **improves average Hits@10 by +21.1%** over baselines

Limitations of DSI++

- Learning embeddings for each individual new docid from scratch incurs prohibitively **high computational costs**

Limitations of DSI++

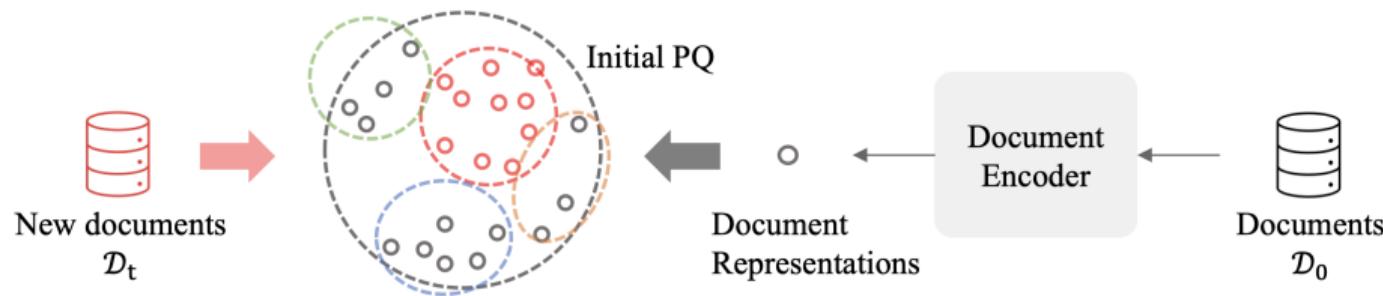

- Learning embeddings for each individual new docid from scratch incurs prohibitively **high computational costs**
- The relationships between new and old documents may not be easily obtained from **randomly-selected exemplars**

CLEVER [Chen et al., 2023]: Incrementally indexing new documents

Incremental product quantization (PQ) codes as identifiers: Update a partial quantization codebook according to two adaptive thresholds

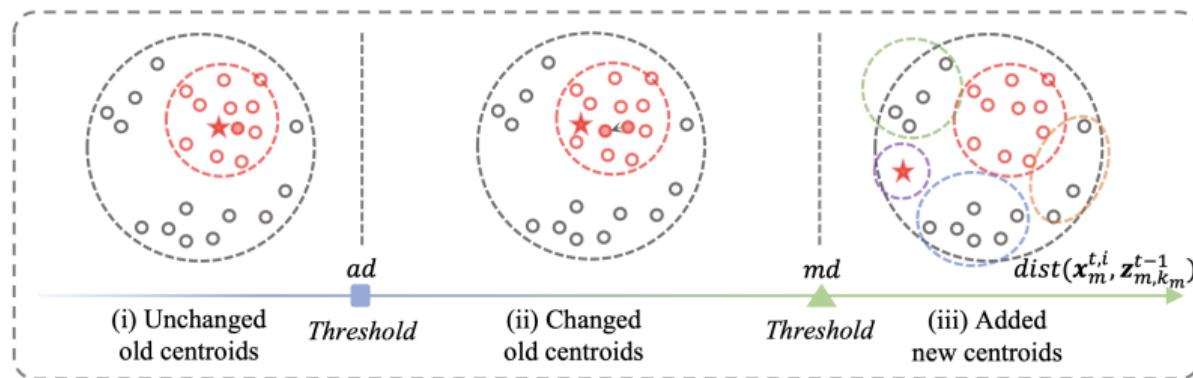

CLEVER [Chen et al., 2023]: Incrementally indexing new documents

Incremental product quantization (PQ) codes as identifiers: Update a partial quantization codebook according to two adaptive thresholds

- Build base PQ
 - Centroids are obtained via clustering over document representations
 - Document representations are learned with a bootstrapped training process

CLEVER [Chen et al., 2023]: Incremental product quantization

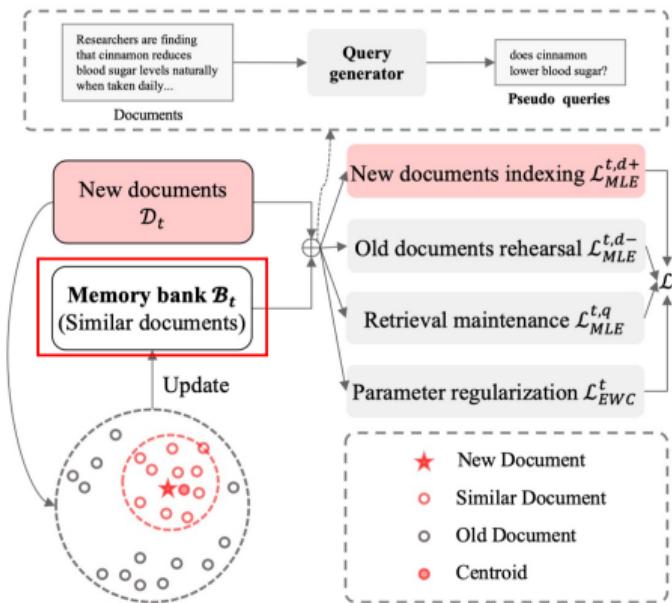

- **Update adaptively**
 - Dynamic thresholds: Average distance (ad); maximum distance (md)
 - Three types of update for centroid representation: Depend on contributions to centroid update

CLEVER [Chen et al., 2023]: Preventing catastrophic forgetting

Memory-augmented learning mechanism: Form meaningful connections between old and new documents

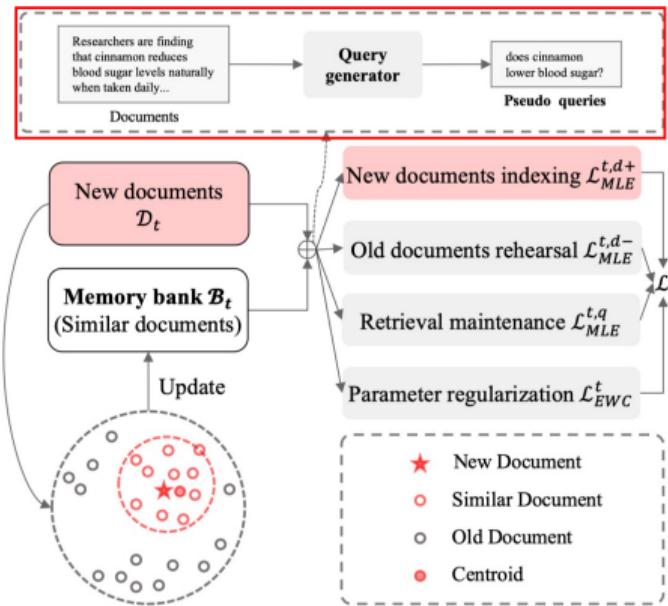

CLEVER [Chen et al., 2023]: Preventing catastrophic forgetting

Memory-augmented learning mechanism: Form meaningful connections between old and new documents

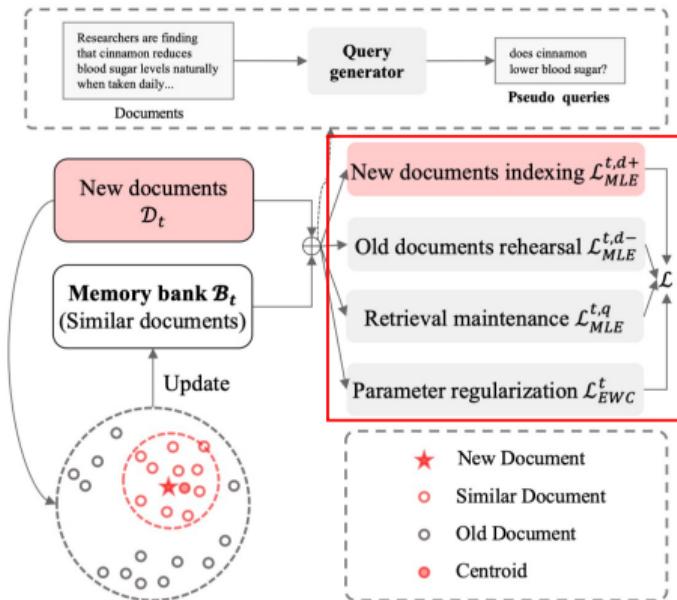

- **Dynamic memory bank:** Construct a memory bank with **similar documents** for each new session and replay the process of indexing them alongside the indexing of new documents

CLEVER [Chen et al., 2023]: Memory-augmented learning mechanism

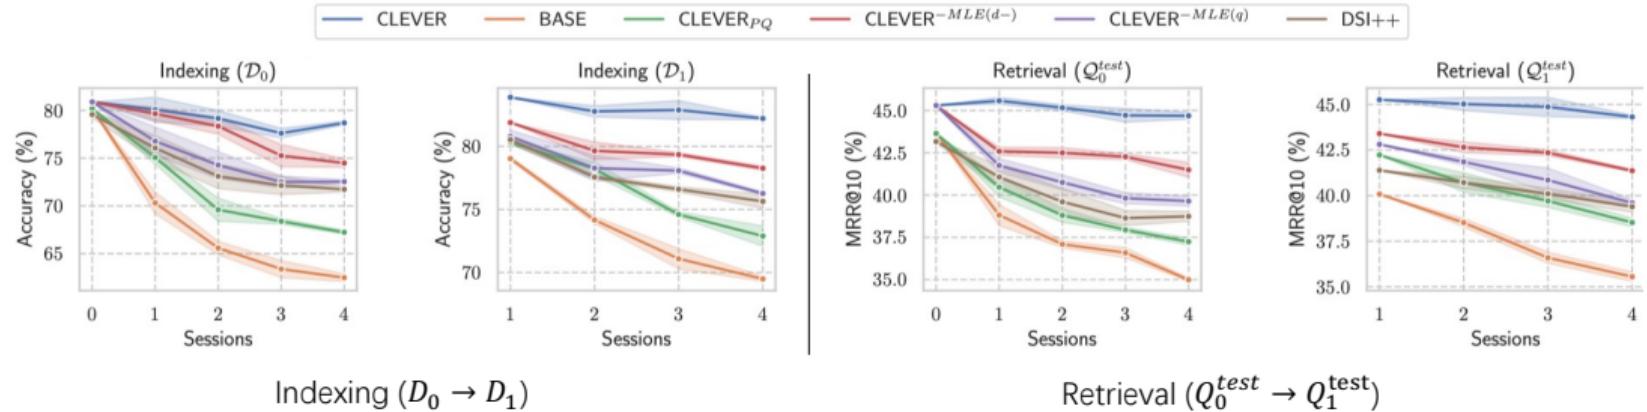

- **Pseudo query-docid pairs:** Train a query generator model to sample pseudo-queries for documents and **supplement the query-docid pairs** during indexing

CLEVER [Chen et al., 2023]: Memory-augmented learning mechanism

- **Sequentially training:** new documents indexing, old document rehearsal, retrieval maintenance losses and an **elastic weight consolidation** (EWC) loss as a regularization term

CLEVER [Chen et al., 2023]: Performance

- CLEVER almost avoids catastrophic forgetting on both indexing and retrieval tasks, showing its effectiveness in a dynamic setting

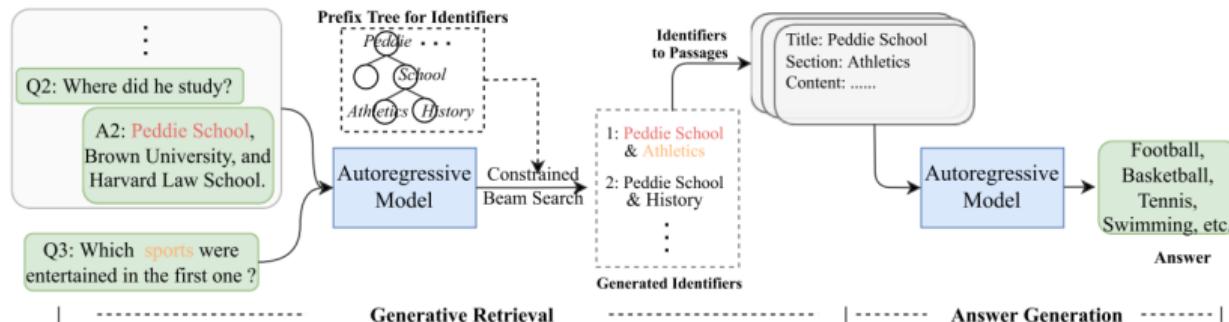

Combination of GR and retrieval-augmented generation (RAG)

How to jointly train the GR model and QA model?

$$\mathcal{L}_{QA}(Q^*, I_D^*, D^*, A; \psi) = - \sum_{q^* \in Q^*, id \in I_D, d \in D, a \in A} \log f(a|q^*, id, d; \psi),$$

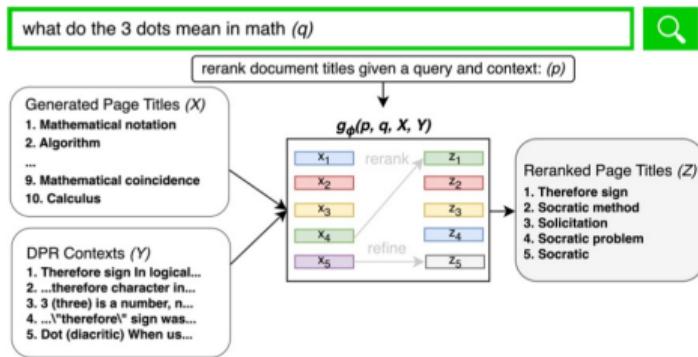

where Q^* is the query set of the downstream task, I_D^* are the docids retrieved by a GR model, D^* are the corresponding documents, a is an answer in the answer set A , f is the QA function and ψ is the model parameters

GCoQA [Li et al., 2023b]

- Step 1: **Document retrieval** with a GR model
- Step 2: **Answer generation** with another autoregressive model

Re3val [Song et al., 2024]

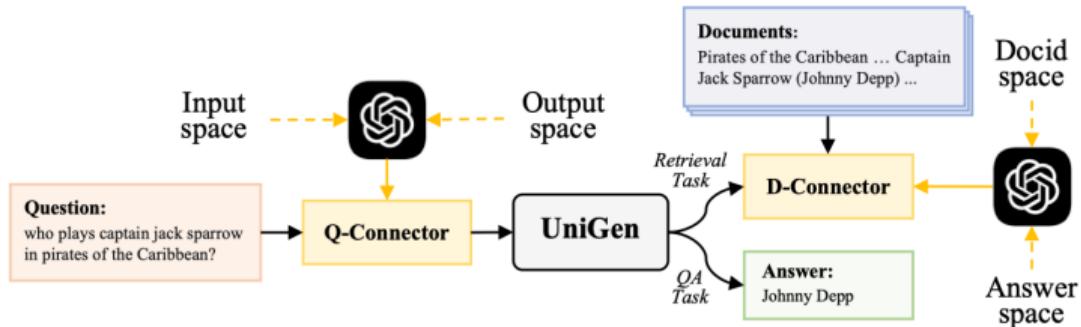

- Step 1: Relevant titles generation using a GR model
- Step 2: Retrieved titles **reranking** using a cross-encoder
- Step 3: **Context retrieval** for titles using BM25
- Step 4: Answer generation using an generative model

Limitation

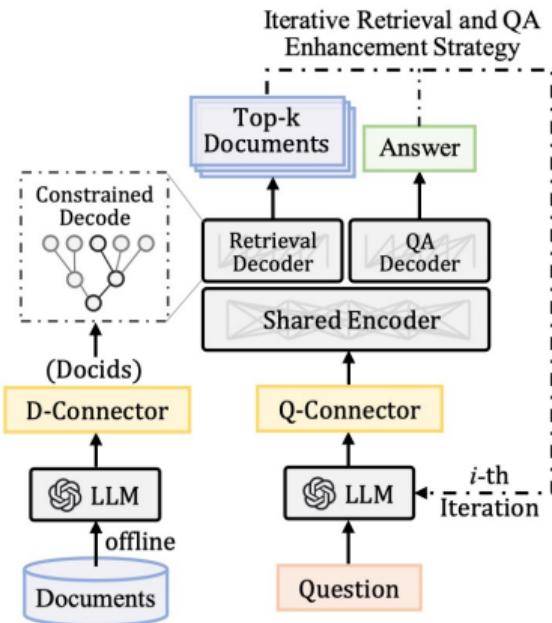

Generative document retrieval and grounded answer generation rely on **separate retrieval and reader module**, which may hinder simultaneous optimization

UniGen [Li et al., 2023a]

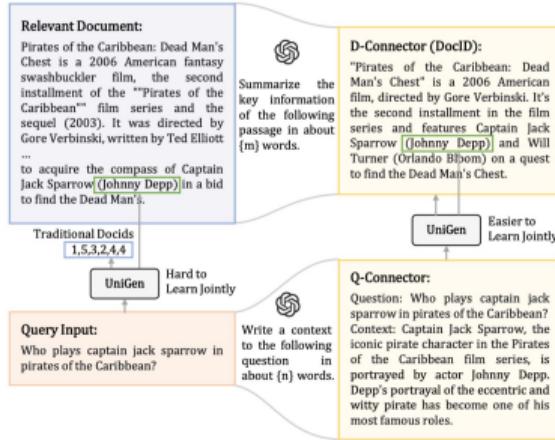

- Joint learning for GR and QA

UniGen [Li et al., 2023a]: Architecture

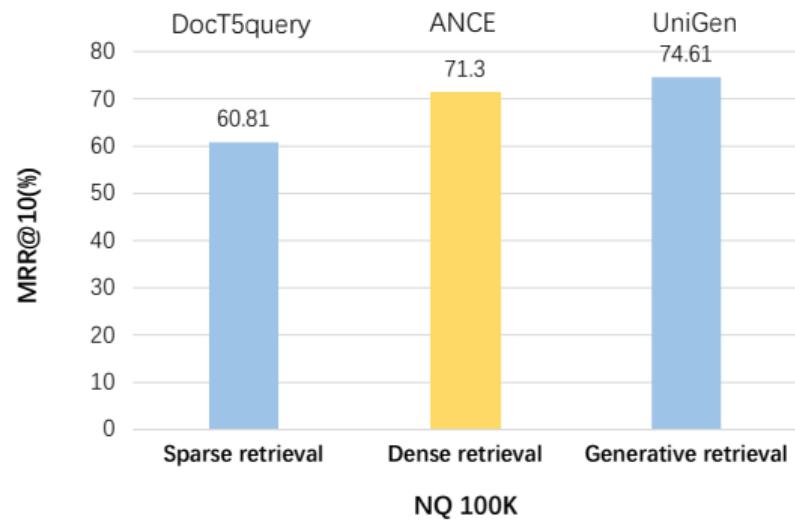

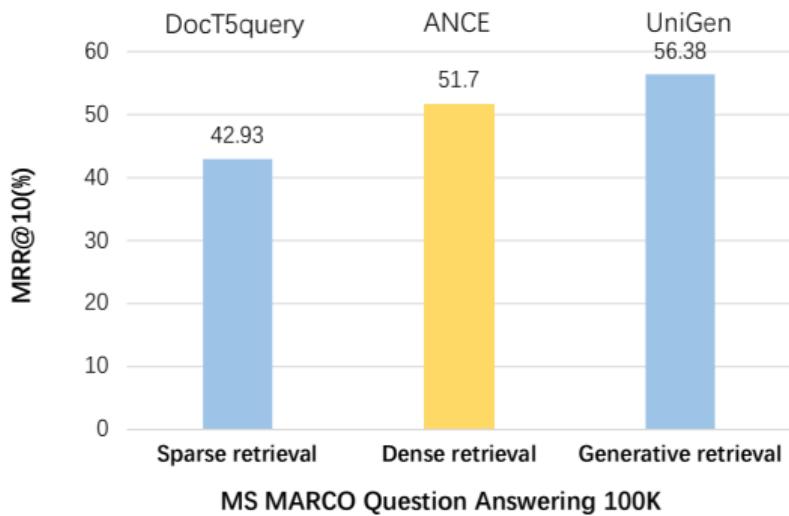

- A shared encoder and two distinct decoders for GR and QA

UniGen [Li et al., 2023a]

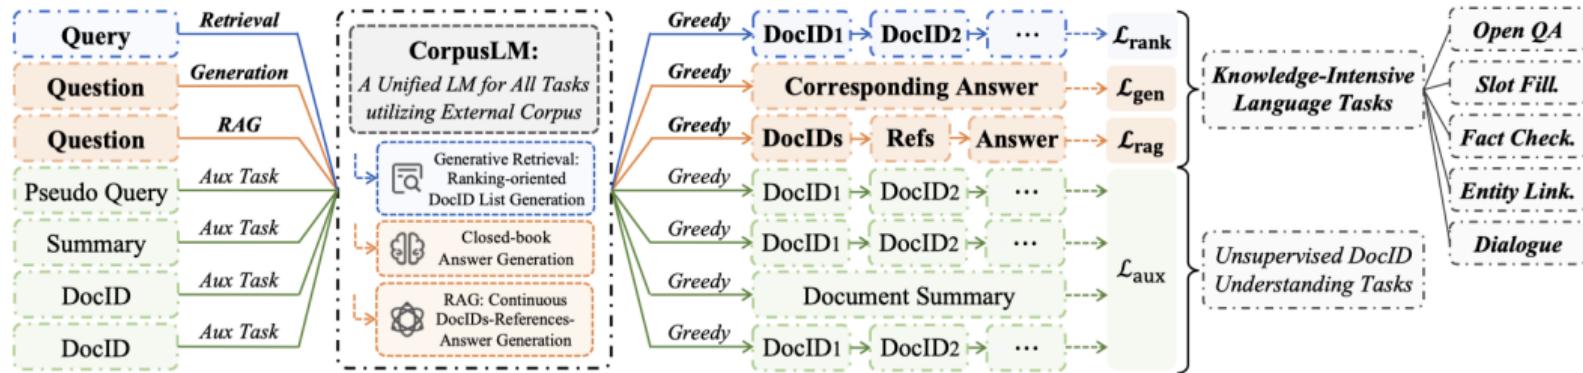

- Use LLMs to generate a query context and document summary, serving as bridges between query inputs, documents, and answer outputs

UniGen [Li et al., 2023a]: Performance

CorpusLM [Li et al., 2024]

- a **unified language model** that leverages external corpus to tackle various knowledge-intensive tasks by integrating GR, closed-book generation, and RAG through a unified greedy decoding process

Limitations in large-scale corpus

- Existing GR models only perform well on artificially-constructed and **small-scale collections**
- Zeng et al. [2024a] and Zeng et al. [2024b] introduced RIPOR and PAG, designed to improve the performance of GR models for MS MARCO dataset, with 8.8M passages.

It is necessary to explore the capacity of GR models to larger corpus

Revisit: Challenges of training approaches

- How to memorize the whole corpus effectively and efficiently?

Revisit: Challenges of training approaches

- **How to memorize the whole corpus effectively and efficiently?**
 - Multi-granularity enhanced document content
 - Pre-training
 - Listwise optimization

Revisit: Challenges of training approaches

- **How to memorize the whole corpus effectively and efficiently?**
 - Multi-granularity enhanced document content
 - Pre-training
 - Listwise optimization
- **How to learn heterogeneous tasks well within a single model?**

Revisit: Challenges of training approaches

- **How to memorize the whole corpus effectively and efficiently?**
 - Multi-granularity enhanced document content
 - Pre-training
 - Listwise optimization
- **How to learn heterogeneous tasks well within a single model?**
 - Pseudo query enhanced input

Revisit: Challenges of training approaches

- **How to memorize the whole corpus effectively and efficiently?**
 - Multi-granularity enhanced document content
 - Pre-training
 - Listwise optimization
- **How to learn heterogeneous tasks well within a single model?**
 - Pseudo query enhanced input
- **How to handle a dynamically evolving document collection?**

Revisit: Challenges of training approaches

- **How to memorize the whole corpus effectively and efficiently?**
 - Multi-granularity enhanced document content
 - Pre-training
 - Listwise optimization
- **How to learn heterogeneous tasks well within a single model?**
 - Pseudo query enhanced input
- **How to handle a dynamically evolving document collection?**
 - Low computational and memory costs
 - Maintaining the retrieval ability
